

This is a living "roadmap" of information architecture (IA) work to use for planning for VA.gov and related experiences. In the map, a **heavy outline means work has already begun**.

Continue to design form landing + detail pages (and search)

Information architecture is about organizing, structuring, and labeling content to help users find information and do tasks. To make sure we all have the same understanding of IA at VA, we'll define the IA role and responsibilities in the June 29 workshop.

We will help you by designing and testing:

- navigation systems – top nav, header, on-page links, side nav, footer, user flows, etc.
- structure – site structure and page templates
- search – user flows, page templates, and tuning
- names and labels – page titles, navigation labels, URLs, and more
- taxonomies – structured metadata (to help users find things)
